1. General data

Performance range

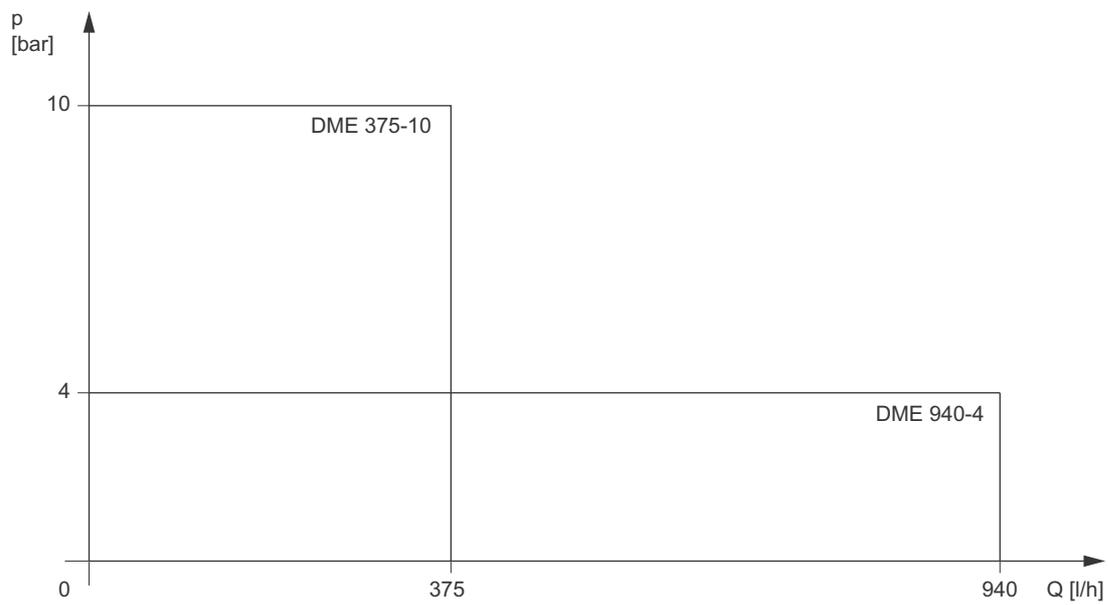

Fig. 1 Performance range DME

TM06 9628 2617

Digital Dosing

Digital Dosing represents state-of-the-art technology. This patented Grundfos solution sets new standards, including new principles and methods.

TM06 9627 2617

Fig. 2 DME pump

Precise and easy setting

The operator can easily install and set the pump to dose exactly the quantity of dosing medium required in the application. In the display, the setting of the pump is read out directly in ml/h or l/h, pulse or batch, and the operation mode is easily identified by means of icons.

Unique technology

A unique drive and microprocessor control ensure that the medium is dosed precisely and with low pulsation even if the pump is operating with high-viscosity or degassing media. Instead of the conventional stroke-length adjustment, the capacity of the DME is regulated by automatic adjustment of the motor speed during the discharge stroke and by fixed suction stroke speed, ensuring optimal and uniform mixing.

Fewer variants to cover all needs

DME pumps feature a powerful variable-speed motor, a turn-down ratio of 1:800 and a complete control interface including:

- Full pulse control
- Pulse-based batch control
- Internal timer-based batch control
- Analog 0/4-20 mA control
- Level control
- Fieldbus communication module.

This ensures that the DME pumps cover the range from 375 to 940 litres per hour up to 10 bar. The switch mode power supply ensures that the same pump is working precisely, irrespective of the mains supply (100-240 V, 50/60 Hz).

The DME dosing pumps feature diaphragm dosing head with integrated vent valve, ball valves at the inlet and outlet. The pumps are fitted with power cable and plug.

★ When dosing crystallising media, a diaphragm leakage sensor must be installed. DME-B is not suitable for crystallising media.

Functional description

The electronically controlled variable-speed motor of the DME pump provides optimum control of the stroke speed. As shown in the figure below, the duration of each suction stroke is constant while the duration of each discharge stroke varies according to the capacity set, resulting in optimum discharge flow in any operating situation.

The advantages:

- The pump always operates at full stroke length, irrespective of the capacity set; this ensures optimum accuracy, priming and suction.
- A capacity range of 1:800 for each pump size.
- Smooth and constant dosing ensuring an optimum mixing ratio at the injection point.
- Significant reduction of pressure surges preventing mechanical stress on diaphragm, hoses, pipes, connections and other dosing parts exposed to leakage and wear.
- The installation is less affected by long inlet and outlet lines.
- Easier dosing of highly viscous and gas-containing liquids.

Maximum capacity button

If the maximum capacity is required over a short period of time, for example during start-up, press the  button on the pump control panel. When the button is released, the pump automatically returns to the previous operating mode.

To set the pump to run for a specific number of seconds at maximum capacity, press the  and  buttons simultaneously. The remaining number of seconds appear in the display. The maximum value is 300 seconds. To stop the pump before the set time has passed, press the  button.

This feature is useful when flushing the pump.

Indicator lights and alarm relay output

Condition	Green LED	Red LED	Display	Alarm output
Pump running	On	Off	Normal indication	
Set to stop	Flashing	Off	Normal indication	
Pump fault	Off	On	EEPROM	
Supply failure	Off	Off	Off	
Pump running, low chemical level ^{★1}	On	On	LOW	
Empty tank ^{★1}	Off	On	EMPTY	
Analog signal < 2 mA	Off	On	NO mA	
The pump is running, but the dosed quantity is too small according to the signal from the dosing monitor ^{★2}	On	On	NO FLOW	
Overheating	Off	On	MAX TEMP	
Internal communication fault	Off	On	INT. COM.	
Internal Hall fault ^{★3}	Off	On	HALL	
Diaphragm (leakage) ^{★4}	Off	On	LEAKAGE	
Max. pressure exceeded ^{★4}	Off ^{★5}	On	OVERLOAD	
More pulses than capacity	On	On	MAX. FLOW	
No motor rotation detected ^{★3}	Off	On	ORIGO	

★1 Requires connection to level sensors. See [Level control](#), page 13.

★2 Requires activation of the dosing monitoring function and connection to a dosing monitor.

★3 Please contact a Grundfos service centre.

★4 Alarms can be reset  when the faults have been corrected.

★5 The pump will make 10 attempts to restart before going into permanent OFF mode.

Menu

The DME dosing pumps feature a user-friendly menu. To activate the menu, press the button . During initial start-up, all menu texts appear in the English language. You can set the menu to display other languages, see page 13.

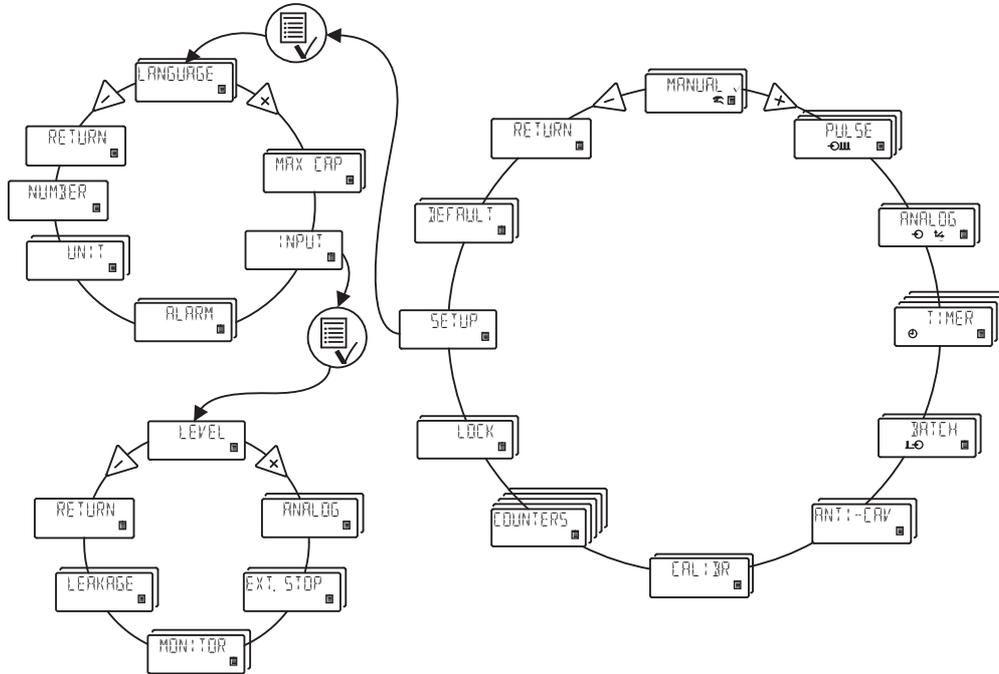

Fig. 7 Menu overview

Operating modes

Manual control

The pump ensures constant dosing according to the quantity set in l/h or ml/h by means of the ◀ and ▶ buttons. The pump automatically changes between the measuring units.

Setting range

Pump type	Setting range	
	From [ml/h]	To [l/h]
DME 375	500	375
DME 940	1200	940

When the anti-cavitation functions is enabled, the maximum flow is reduced (see page 12).

Pulse control

Applies to DME-AR and DME-AP

The pump doses according to an external pulse signal, for example from a water meter.

There is no direct relation between pulses and dosing strokes. The pump automatically calculates its optimal speed to ensure that the required quantity is dosed for each pulse. The quantity to be dosed is set in ml/pulse. The pump adjusts its speed and/or stroke frequency according to two factors:

- The frequency of external pulses
- The set quantity per pulse.

Setting range

Pump type	Setting range [ml/pulse]
DME 375-10	0.00392 - 750
DME 940-4	0.00980 - 1880

Analog 0/4-20 mA control

Applies to DME-AR and DME-AP

The pump ensures dosing according to an external analog signal. The dosed capacity is proportional to the input value in mA.

Setting	Input signal	Dosed quantity as a percentage of the max. capacity*
4-20 (default):	4 mA	0 %
	20 mA	100 %
20-4:	4 mA	100 %
	20 mA	0 %
0-20:	0 mA	0 %
	20 mA	100 %
20-0:	0 mA	100 %
	20 mA	0 %

* If a maximum capacity limitation has been set, the dosed quantity is a percentage of the set capacity limitation (see page 12).

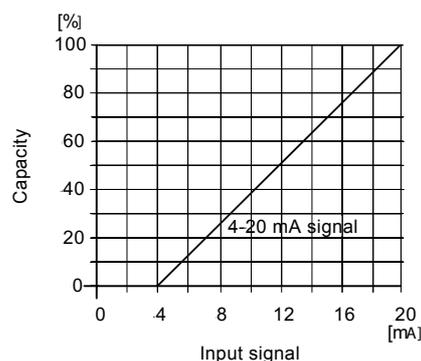

Fig. 8 4-20 mA control

Timer-based batch control

Applies to DME-AR and DME-AP

The set quantity is dosed in batches at maximum capacity or the set capacity limitation.

The time until the first dosing (NX) and the following sequences (IN) can be set in minutes, hours and days. The maximum time limit is 9 days, 23 hours and 59 minutes (9:23:59). The lowest acceptable value is one minute. IN must be higher than the time required to perform one batch. If IN is lower than the time required, the next batch will be ignored.

In case of supply failure, the set dosing quantity, the IN time and the remaining NX time are stored. When the supply is reconnected, the pump starts up with the NX time at the time of the supply failure. Thus, the timer cycle continues, but it will be delayed according to the time of the supply failure.

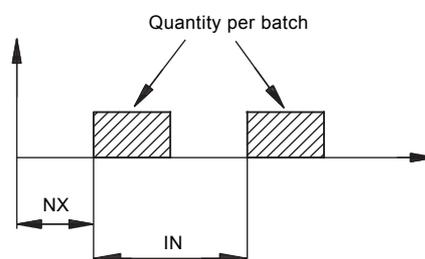

Fig. 9 Timer-based batch control

Setting range

Pump type	Setting range	
	From [ml/batch]	To [l/batch]
DME 375	39.1	750
DME 940	97.9	1880

Pulse-based batch control

Applies to DME-AR and DME-AP

The set quantity is dosed in batches at maximum capacity or the set capacity limitation. The quantity is dosed every time the pump receives an external pulse. If the pump receives new pulses before the batch is completed, these pulses will be ignored.

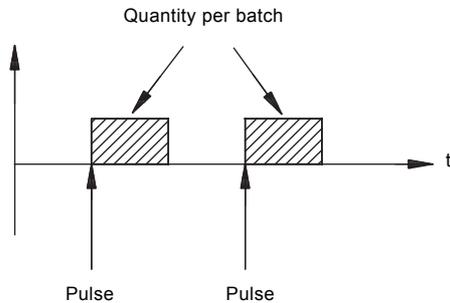

Fig. 10 Pulse-based batch control

TM04 8831 1513

Setting range

Pump type	Setting range	
	From [ml/batch]	To [l/batch]
DME 375	39.1	750
DME 940	97.9	1880

Anti-cavitation

When the anti-cavitation function is selected, the pump extends and smooths its suction stroke. This results in a softer suction stroke.

The anti-cavitation function is used in these situations:

- When pumping high-viscosity liquids
- When pumping degassing liquids
- When the inlet line is long
- When the suction lift is high.

Depending on the circumstances, the motor speed during the suction stroke can be reduced to approximately 75 %, 50 % or 25 % of the normal motor speed. When using the anti-cavitation function, the maximum pump capacity is reduced.

Maximum capacity limitation

Maximum capacity limitation makes it possible to reduce the maximum capacity (MAX. CAP). It influences the functions in which the pump normally operates at maximum capacity. Under normal operating conditions, the pump cannot operate at a capacity higher than the one stated in the display. When pushing the maximum capacity button, the pump operates at 100 %.

With the maximum capacity limitation function, a large pump can be set to operate as a much smaller pump. Together with the 1:800 capacity range, this function allows the following:

1. To utilize the smooth and even dosing characteristics of the pump at low capacities to achieve
 - improved chemical mixing
 - improved dosing through long outlet lines
 - improved dosing of high-viscosity liquids.

2. To improve the dosing of gas-containing liquids: In a large pump, the displaced volume (1) is much larger than the non-displaced volume (2).

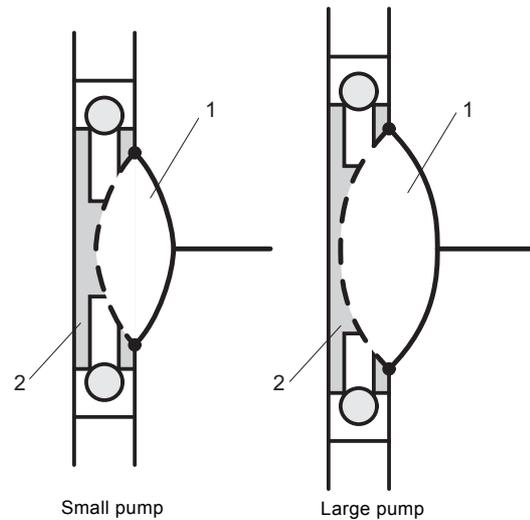

Fig. 11 Anti-cavitation

TM04 8832 1513

3. To cover several needs with just one pump size.
4. To adapt the pump to a 4-20 mA signal control with 4 mA corresponding to 0 % and 20 mA to the set maximum capacity.

This allows you to use a DME for dosing a very small quantity of liquid without having to change the input signal.

Example:

A DME 375 receives a 12 mA input signal from a control instrument. According to the analog curve (see page 11), this results in a 50 % output and a capacity of 188 l/h.

A new situation occurs where it is only necessary to dose 47 l/h: The maximum capacity limitation is set to 94 l/h. The pump is still receiving a 12 mA signal resulting in a 50 % output and a capacity of 47 l/h.

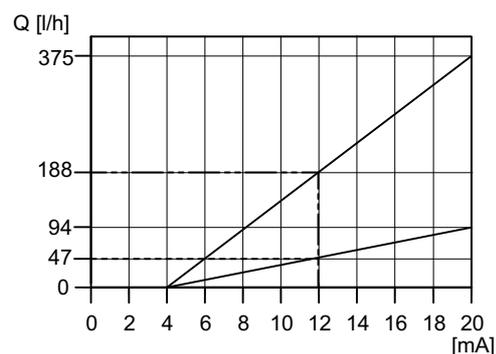

Fig. 12 Maximum capacity limitation

TM06 9631 2617

The maximum capacity limitation also reduces the pump speed in timer-based batch control, pulse-based batch control and during calibration where the pump usually operates at maximum capacity.

Calibration

After start-up, the dosing pumps can be calibrated for the actual installation to ensure that the displayed value (millilitres or litres) is correct. A calibration program in the set-up menu facilitates calibration.

Counters

The pump can display non-resettable counters for:

- "Quantity":
Accumulated dosed quantity in litres or US gallons.
- "Strokes":
Accumulated number of dosing strokes.
- "Hours":
Accumulated number of operating hours (power on).
- "Power ON":
Accumulated number of times the mains supply has been switched on.

Languages

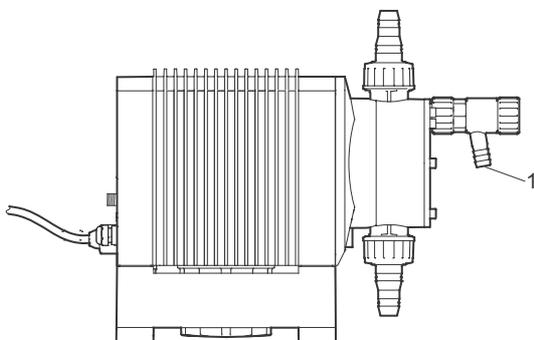

The display text can be displayed in one of the following languages chosen in the set-up menu:

- English, German, French, Italian, Spanish, Portuguese, Dutch, Swedish, Finnish, Danish, Czech, Slovak, Polish, Russian.

Integrated vent valve

The DME dosing pumps are provided with an integrated vent valve (1). The vent valve makes priming during start-up very easy.

The vent valve must be connected to the tank by means of a 15/20 mm PVC hose.

TM06 9632 2617

Fig. 13 Integrated vent valve

Switch-mode power supply

The DME pump incorporates a switch-mode power supply. This makes the pump independent of variations in supply voltage and frequency.

Operating range: 1 x 100-240 V, 50/60 Hz.

Level control

Applies to DME-AR and DME-AP

The pump can be connected to a level control unit for monitoring of the chemical level in the tank. The pump can react to two level sensor signals.

Level sensors	Pump reaction
Upper sensor activated	<ul style="list-style-type: none"> • Red indicator light is on. • Pump is running. • Alarm relay is activated.★
Lower sensor activated	<ul style="list-style-type: none"> • Red indicator light is on. • Pump stops. • Alarm relay is activated.★

★ Applies to control variant AR.

Bus communication

The DME-AP is available with a built-in module for bus communication with PROFIBUS DP systems. This module enables remote monitoring and setting via the fieldbus system.

All DME features are available via bus communication. The PROFIBUS GSD-files can be found on the product CD included in the standard delivery.

Diaphragm leakage sensor

The pump can be fitted with a diaphragm leakage sensor. The sensor is connected to the drain hole of the dosing head. In case of leakage of the diaphragm, the signal from the sensor generates an alarm in the pump, and the alarm relay is activated. When dosing crystallising media, a diaphragm leakage sensor must be installed.

Control panel lock

It is possible to lock the buttons on the control panel to prevent maloperation of the pump. The locking function can be set to ON or OFF. The default setting is OFF.

A PIN code is required to change from OFF to ON. When ON is selected for the first time, "_____" appears in the display. If a code has already been entered, the code will appear when an attempt to change to ON is made. This code can either be re-entered or changed.

Units

It is possible to select metric units (litre/millilitre) and US units (gallons/millilitre).

Metric measuring units

- In manual and analog modes, set the quantity to be dosed in litres per hour (l/h) or millilitres per hour (ml/h).
- In pulse mode, set the quantity to be dosed in ml/pulse. The actual capacity is indicated in litres per hour (l/h) or millilitres per hour (ml/h).
- For calibration, set the quantity to be dosed in ml per 100 strokes.
- In timer and batch modes, set the quantity to be dosed in litres (l) or millilitres (ml).

Under the QUANTITY menu item in the COUNTERS menu, the dosed quantity is indicated in litres.

US measuring units

- In manual and analog modes, set the quantity to be dosed in gallons per hour (gph).
- In pulse mode, set the quantity to be dosed in ml/pulse. The actual capacity is shown in gallons per hour (gph).
- For calibration, set the quantity to be dosed in ml per 100 strokes.
- In timer and batch modes, set the quantity to be dosed in gallons.

Under the QUANTITY menu item in the COUNTERS menu, the dosed quantity is indicated in gallons (gal).

8. Pumped liquids

The resistance table below is intended as a general guide for material resistance (at room temperature), and does not replace testing of the chemicals and pump materials under specific working conditions.

The data shown are based on information from various sources available, but many factors (purity, temperature, abrasive particles, etc.) may affect the chemical resistance of a given material.

Note: Some of the liquids in this table may be toxic, corrosive or hazardous. Please be careful when handling these liquids.

Pumped liquid (20 °C)			Materials						
			Dosing head			Gasket			Ball
Description	Chemical formula	Concentration [%]	PP	PVDF	SS 1.4401	FKM	EPDM	PTFE	Ceramic
			Acetic acid	CH ₃ COOH	25	•	•	•	-
60	•	•			•	-	•	•	•

		80-98	○	•	-	•	-	•	•

• Resistant

○ Limited resistance

- Not resistant

★1 Risk of crystallisation. DME-B is not suitable for crystallising media.

★2 Reacts violently with water and generates much heat. (Pump should be absolutely dry before dosing sulphuric acid.)

★3 Must be fluoride-free when glass balls are used.

★4 In neutral solutions.

★5 Saturated solution 0.1 %.

9. Grundfos Product Center

Online search and sizing tool to help you make the right choice.

<http://product-selection.grundfos.com>

"SIZING" enables you to size a pump based on entered data and selection choices.

"REPLACEMENT" enables you to find a replacement product. Search results will include information on the following:

- the lowest purchase price
- the lowest energy consumption
- the lowest total life cycle cost.

The screenshot shows the Grundfos Product Center website. At the top, there is a navigation bar with the logo and a search bar. Below the navigation bar, there are four main sections: SIZING, CATALOGUE, REPLACEMENT, and LIQUIDS. The SIZING section is highlighted, showing a 'QUICK SIZING' form with input fields for 'Flow (Q)*' and 'Head (H)*', and radio buttons for 'Select what to size by'. The CATALOGUE section is also visible, showing a search bar and a 'SEARCH' button. The LIQUIDS section is highlighted, showing a search bar and a 'SEARCH' button.

REPLACEMENT Replace an old pump with a new

LIQUIDS Find pump by liquid

QUICK SIZING

Enter duty point:

Flow (Q)* m³/h

Head (H)* m

Select what to size by:

Size by application

Size by pump design

Size by pump family

START SIZING

ADVANCED SIZING: Advanced sizing by application Guided selection

"CATALOGUE" gives you access to the Grundfos product catalogue.

"LIQUIDS" enables you to find pumps designed for aggressive, flammable or other special liquids.

All the information you need in one place

Performance curves, technical specifications, pictures, dimensional drawings, motor curves, wiring diagrams, spare parts, service kits, 3D drawings, documents, system parts. The Product Center displays any recent and saved items - including complete projects - right on the main page.

Downloads

On the product pages, you can download installation and operating instructions, data booklets, service instructions, etc. in PDF format.
